QUALITY CERTIFICATE

(This applies to all those brushes we manufacture on our PBT line)

We certify that all our brushes, included on our PBT line, are able to be used in the food industry, according with HACCP principles and fulfilling the international requirements on specifications for raw materials used during our manufacturing process.

The main characteristics on each of those brushes are:

1. PBT Fiber FDA 21 CFR 177.1660,0178.3297
Its main selling points are clearly its suitability for applications involving contact with food products, its complete absence of hygroscopic, its strength and color fastness. Since this fiber can be sterilized at extremely high temperatures, they are perfect brushes for the food-industry.
2. Polypropylene Block: FDA 21 CFR 177.1520
All blocks are made with 100% virgin copolymer polypropylene and pigmentation compounds are FDA approved to be used in direct contact with food.
3. Staple Wire: Each tuft of fiber is fixed to the block using stainless steel wire to avoid any possible contamination caused by corrosion due to the wire rusting.
4. Color Code: All our models are manufactured in 6 different colors with the purpose of allowing the users to establish a color code system that will prevent cross contamination according with HACCP principles.

Using the proper brush reduces the risk of cross contamination, but it does not eliminate the user responsibility to properly clean the tools after each usage.
